

DYNAMIC TECHNOLOGIES: A FLEXIBLE AND SECURE SOLUTION

DYNAMIC TECHNOLOGIES, solutions for the automotive and industrial sector.

Dynamic Technologies Group works both for the automotive sector, as a Tier-1 components supplier for some of the main car producers in the world, and for the industrial sector: it produces cooling lines and automobile air-conditioning tubes, and similar or accessory components, in aluminum and other materials.

BRANCH

Automotive and industrial.

PROBLEM

Integration, with many national and international partners, for exchanging confidential data in different formats.

REQUEST

When Dynamic Technologies changed ERP, they searched for an alternative to the **EDI supplier** at that time: It had to be an expert and a fast moving company, with flexible prices and moreover customer oriented. Data has to be transmitted through a secure channel, because also very confidential data, the **CAD drawings** of component prototypes are exchanged.

SOLUTION

Thanks to the **EDI service D/cct**, Dynamic Technologies uses **only one format** to communicate with all its partners and has further simplified its processes by moving the client **database data conversion** from the company's ERP to DERWID's system. Moreover using the **value added network D/van** CAD drawings of prototypes are sent through the **secure transmission channel OFTP2**.

BENEFITS

Right from the first test transmissions - flows were not completely defined - Dynamic Technologies' customers noted a remarkable **increase in the quality** of data compared to the previous solution. During these years of partnership, Dynamic Technologies has appreciated cost savings compared to the previous supplier, DERWID's commercial flexibility, decency and transparency and its speed of implementation, which have been confirmed over time.
